

BVSR

# Creative Problem Solving as Campbellian BVSR 

Quantitative Creativity Measure and Blind-Sighted Metric

## Background

- Donald T. Campbell's (1960) BVSR model of creativity and discovery
- Then controversies and confusions
- e.g., randomness, equiprobability, volition, Darwinism ... ad infinitum
- total chaos for the next 50 years!
- Then it dawned on me:

## Background

- Nobody - neither proponents nor opponents - knew what they were talking about!
- Absolutely nobody defined their terms!
- Not even Campbell!

## Background

- Hence, we need a formal treatment that allows logical deductions and demonstrations
- To keep the discussion simple, this treatment will be expressed in terms of creative problem solving

## Definitions

- Given a problem that needs to be solved:
- Goal with attainment (utility) criteria
- For complex problems: subgoals with their separate attainment criteria
- Goals and subgoals may form a goal hierarchy
- e.g., writing a poem: the composition's topic or argument, its length and structure, meter or rhythm, rhyme and alliteration, metaphors and similes, and the best word for a single place that optimizes both sound and sense (cf. Edgar Allan Poe's 1846 "The Philosophy of Composition")

## Definitions

- Solution variants (alternative solutions or parts of solutions): e.g.,
- algorithms, analogies, arrangements, assumptions, axioms, colors, conjectures, corollaries, definitions, designs, equations, estimates, explanations, expressions, forms, formulas, harmonies, heuristics, hypotheses, images, interpretations, media, melodies, metaphors, methods, models, narratives, observations, parameters, patterns, phrasings, plans, predictions, representations, rhymes, rhythms, sketches, specifications, start values, statistics, structures, techniques, terms, themes, theorems, theories, words
- all depending on nature of problem

## Definitions

- Creative solution:
- Three-criterion definitions
- US Patent Office: new, useful, and nonobvious
- Boden (2004): novel, valuable, and surprising
- Amabile (1996):
- novel
- appropriate, useful, correct, or valuable
- heuristic rather than algorithmic

## Definitions

- Creative solution:
- To wit, creativity requires some degree of a "Eureka!" or "Aha!" experience
- Cf. "reasonable" versus "unreasonable" problems (Perkins, 2000):
- reasonable problems "can be reasoned out step by step to home in on the solutions."
- unreasonable problems "do not lend themselves to step-by-step thinking. One has to sneak up on them."

## Definitions

- Creative solution: Here -
- original (rather than "novel")
- useful (noun "utility")
- surprising (noun "surprisingness")
- innovations, not mere adaptations
- inventions, not just improvements
- productive, not reproductive thought

## Definitions

- Solution parameters: $x_{i}$ characterized by
- initial generation probability: $p_{i}$
- hence, solution variant originality $=\left(1-p_{i}\right)$
- final utility: $u_{i}$ (probability or proportion): either
- probability of selection-retention, or
- proportion of $m$ criteria actually satisfied
- prior information: $v_{i}$ (actual knowledge of $u_{i}$ )
- hence, solution variant surprisingness $=\left(1-v_{i}\right)$
- N.B.: These parameters are subjective

## $k$ Solution Variants

| Solution | Probability | Utility | Information |
| :---: | :---: | :---: | :---: |
| $x_{1}$ | $p_{1}$ | $u_{1}$ | $v_{1}$ |
| $x_{2}$ | $p_{2}$ | $u_{2}$ | $v_{2}$ |
| $x_{3}$ | $p_{3}$ | $u_{3}$ | $v_{3}$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $x_{i}$ | $p_{i}$ | $u_{i}$ | $v_{i}$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $x_{k}$ | $p_{k}$ | $u_{k}$ | $v_{k}$ |

$$
\begin{gathered}
0<p_{i} \leq 1, \Sigma p_{i} \leq 1 \\
0 \leq u_{i} \leq 1, \Sigma u_{i} \leq k ; 0 \leq v_{i} \leq 1, \Sigma v_{i} \leq k
\end{gathered}
$$

## Two Special Types

- Reproductive:
- $p_{i}=u_{i}=v_{i}=1$
- i.e., low originality, high utility, low surprise
- BVSR utterly unnecessary because variant "frontloaded" by known utility value
- i.e., $u_{i}$ implies $p_{i}$ via $v_{i}$
- Selection reduces to mere "quality control" to avoid calculation mistakes or memory slips
- But also routine, even algorithmic thinking, and hence not creative

## Two Special Types

- Productive:
- $p_{i} \neq 0$ but $p_{i} \approx 0$ (high originality)
- $u_{i}=1$ (high utility)
- $v_{i}=0$ or $v_{i} \approx 0$ (high surprise)
- BVSR mandatory to distinguish productive from potential solutions where $p_{i} \neq 0$ and $v_{i}=0$ but $u_{i}=0$
- i.e., because the creator does not know the utility value, must generate and test to find out
- Hence, innovative, inventive, or creative thinking

## Obtaining Quantitative Indices

- The creativity of single solution variants
- The "sightedness" of solution sets

## Creativity Measure

- What is the most creative solution in the set of $k$ solutions?
- $c_{i}=\left(1-p_{i}\right) u_{i}\left(1-v_{i}\right)$
- where $0 \leq c_{i}<1$ (N.B.: why $c_{i} \neq 1$ )
- $c_{i} \rightarrow 1$ as
- $p_{i} \rightarrow 0$ (maximizing originality),
- $u_{i} \rightarrow 1$ (maximizing utility), and
- $v_{i} \rightarrow 0$ (maximizing surprise)
- $c_{i}=0$ if $p_{i}=1$ and $v_{i}=1$ (or $u_{i}=0$ )
- e.g., reproductive variant $p_{i}=u_{i}=v_{i}=1$

## Creativity Measure

- Examples:
- $p_{i}=.1, u_{i}=1, v_{i}=0, c_{i}=.9$
- fully "blind" solution
- $p_{i}=.1, u_{i}=1, v_{i}=.1, c_{i}=.81$
- "hunch" implies less creativity
- $p_{i}=.1, u_{i}=.5, v_{i}=.1, c_{i}=.405$
- less utility implies less creativity

## Creativity Measure

- Individualistic vs. collectivistic cultures:
- letting $v_{1}=v_{2}=0$
- $p_{1}=.001$ and $u_{1}=.5$ (originality $>$ utility)
- $p_{2}=.5$ and $u_{2}=1$ (originality <utility)
- $c_{1} \approx .5$ (or .4995, exactly)
- $C_{2}=.5$
- e.g., ...

Xu Daoning's Fishermen's Evening Song

Jackson Pollock's No. 5, 1948

## Blind-Sighted Metric

- Goal: a measure for any set of $k$ solution variants that indicates the relative amount of sightedness and blindness:
- $S=1 / k \Sigma p_{i} u_{i} v_{i}$, where $0 \leq S \leq 1$
- $S=1$ when set is perfectly "sighted"
- $S=0$ when set is perfectly "blind"
- Why $v_{i}$ must be included in the metric (viz. necessary and sufficient metric that forbids "lucky guesses")
- Hence, blindness $B=1-S$
- Combining with the creativity measure ...

## "Fork in the Road" $k=2$

| 5 | .20 | 1 | 0 | .20 | .04 | .64 | 0 |

Hence, variant superfluity $\rightarrow$ BVSR

## Selection Procedures

- External versus Internal
- Introduces no complications
- Simultaneous versus Sequential
- Latter introduces complications
- In particular, although sightedness will tend to increase with successive generate-and-tests, this upward tendency need not be monotonic or incremental when no solution has perfect utility
- The consequence: Backtracking $\rightarrow$ BVSR

## Selection Procedures

- Two alternative sequential scenarios
- Informed guess: Elimination
- Total ignorance: Exploration
- In both scenarios assume that $u$-max $=.9$
- i.e., no perfect solution, but one that is satisfactory

## Selection Procedures

- Consequences for $p_{i}$ :
- When a solution is tested and rejected its probability (temporarily) set to zero
- For the remaining solutions, two scenarios
- Elimination: normalization $\Sigma p_{i}=1$ at each trial because BVSR ensures solution identification
- Exploration: no normalization, so that remaining probabilities remain unchanged
- because BVSR does not ensure solution identification
- the solution set may contain no solution, partial or otherwise

## First: <br> Sequential Selection

Informed guess: Elimination

Sketch 11

Final Version

## Second critical lesson BVSR increases $S_{t}$ (decreases $B_{t}$ ): e.g. ...

benzene ring

## Discussion

- I have just shown how BVSR has an intimate connection with creative problem solving
- Moreover, I have provided the rationale for two universal BVSR signs: variant superfluity and backtracking
- However, it should be equally clear from the formal definitions that the BVSR-creativity connection is essential rather than accidental (i.e., it is not contingent on the particular computational examples shown)

## Discussion

- E.g., in a set of $k$ variants with one useful solution $x_{1}$ :
- $S \rightarrow 1$ as $p_{1} \rightarrow 1, u_{1} \rightarrow 1$, and $v_{1} \rightarrow 1$,
- and for all $i \neq 1, p_{i} \rightarrow 0, u_{i} \rightarrow 0$, and $v_{i} \rightarrow 0$, implying that $k \rightarrow 1$ (because $\Sigma p_{i} \leq 1$ ), whereas
- $c_{1} \rightarrow 1$ as $p_{1} \rightarrow 0, u_{1} \rightarrow 1$, and $v_{1} \rightarrow 0$,
- implying that $k \gg 1$ (variant superfluity)
- In general, highly sighted sets cannot possibly contain highly creative solutions

## Discussion

- In contrast, absolutely nothing prevents a highly creative solution from emerging in a set where $S=0$ (i.e., $B=1$ ), for
- $S=0$ when $p_{i} u_{i} v_{i}=0$ for all $i$, indicating that any solution with $p_{i}>0$ and $u_{i}>0$ must have $v_{i}=0$, a stipulation consistent with $c_{i} \gg 0$
- If $v_{i}=0$, then $c_{i} \rightarrow 1$ as $p_{i} \rightarrow 0$ and $u_{i} \rightarrow 1$ while $S=0$
- E.g., serendipitous discoveries

## Discussion

- Yet is BVSR-creativity link so close that it lacks empirical content?
- Is it tantamount to an assertion like "All bachelors are unmarried"?
- The answer is complex:
- On the one hand, the BVSR-creativity connection cannot be disproved empirically
- On the other hand, the operation of BVSR in creativity can be empirically investigated!

## Discussion

- For example, we can ask:
- What cognitive processes and behavioral procedures generate sets that contain at least one solution where $p_{i} \rightarrow 0, u_{i} \rightarrow 1$, and $v_{i} \rightarrow 0$ ?
- What characteristics enable a person to engage in the foregoing cognitive processes and behavioral procedures?
- What environmental factors encourage or discourage a person from engaging in those processes or procedures?

## Discussion

- To illustrate, what is the function of
- reduced latent inhibition?
- remote association?
- divergent thinking?
- behavioral tinkering?
- general intelligence?
- introversion?
- "positive" schizotypy or psychoticism?
- domain-specific expertise?
- multicultural experiences?
- These are all valid empirical questions!

## Conclusion

- What we can't deny is that BVSR $\rightarrow$ creativity
- So ...
- Donald Campbell (1960) was right!
- [P.S.: If only he had worked out the analytical details!]
